Outline

Text and blocks

Figures and tables

Equations and code

Text and blocks

Lists and emphasis

- Plain text is Noto Sans, with vermillion for alerts and *italics* for terms
- 繁體中文可直接輸入，technical terms 保留 English
- Nested lists
  - Second level keeps the same line spacing
  - Third level is rarely needed
- Numbered steps
  1. Align reads to the reference
  2. Call variants and normalize them
  3. Annotate and filter

Blocks

Definition

The Phred score Q of a base call is $Q = -10 \log_{10} P_{\text{error}}$.

Warning

Check the genome build before you merge coordinates from two tables.

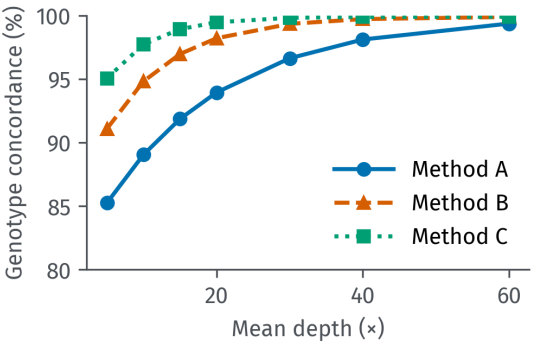

Example

$Q = 30$ corresponds to one expected error in 1,000 base calls.

Figures and tables

Figure with text

- Concordance rises with depth
- Method C reaches 99% at 20×
- Lines differ by color, marker, and dash

Simulated data, for layout only.

Table

Caller	Precision (%)	Recall (%)	F1 (%)
Method A	97.1	92.4	94.7
Method B	98.3	95.0	96.6
Method C	99.0	97.8	98.4

Simulated values for layout only.

Equations and code

Equations

Hardy-Weinberg genotype frequencies for allele frequencies $p + q = 1$:

$$p^2 + 2pq + q^2 = 1$$

Posterior probability of genotype G given reads D:

$$P(G \mid D) = \frac{P(D \mid G)\, P(G)}{\sum_g P(D \mid g)\, P(g)}$$

$$F_1 = \frac{2\,\mathsf{TP}}{2\,\mathsf{TP} + \mathsf{FP} + \mathsf{FN}}$$

Code

```python
import pysam

def count_pass(path: str, min_qual: float = 30.0) -> int:
    # Count PASS records with QUAL >= min_qual
    with pysam.VariantFile(path) as vcf:
        return sum(1 for rec in vcf if rec.qual >= min_qual)
```

```bash
# Keep PASS variants and index the result
bcftools view -f PASS -Oz -o pass.vcf.gz calls.vcf.gz
tabix -p vcf pass.vcf.gz
```
